| Modul PAFMF002 Electronic S   | Structure Theory   |
|---|--|
| Module code   | PAFMF002   |
| Module title (German)   | Theorie der Elektronenstruktur   |
| Module title (English)  | Electronic Structure Theory  |
| Person responsible for the module   | Prof. Dr. U. Peschel   |
| Prerequisites for admission to the module   | -  |
| Recommended or expected prior knowledge   | -  |
| Prerequisite for what other modules   | -  |
| Type of module (compulsory module, required elective module, elective module)                                 | 128 M.Sc. Physics: Required elective module<br>528 M.Sc. Quantum Science and Technology, required elective module,<br>subject area "specialization"  |
| Frequency of offer (how often is the module offered?)   | Every second semester (beginning in summer semester)   |
| Duration of module  | 1 semester   |
| Module Components/Types of courses (lecture, practical course, lab, tutorial, exercise, seminar, internship,) | Lecture: 2 h per week Exercise: 3 h per week   |
| ECTS credits  | 8 CP   |
| Work load: - In-class studying - Independent studying (incl. preparations for examination)                    | 240 h<br>75 h<br>165 h   |
| Content   | Introduction to the many-body problem; Wavefunction-based approaches for electronic structure; Density functional theory; Electronic excitations: beyond density functional theory.  |
| Intended learning outcomes  | Electronic structure theory is a successful and ever-growing field, shared by theoretical physics and theoretical chemistry, that takes advantage from the increasing availability of high-performance computers.  Starting only from the knowledge of the types of atoms that constitute a material (molecule, solid, nanostructure,) students will learn how to determine without further experimental input, i.e. using only the laws of quantum physics, its structural and electronic properties.  The lecture will initiate the students to the state-of-the-art theoretical and computational approaches used for electronic structure calculations. In the practical classes the students will learn through tutorials to use different software for electronic structure simulations. During the last month they will realize a small independent scientific project. |

| Prerequisites for admission to the module examination         | Course exercises to be submitted; Further information on the kind and scope will be given at the beginning of each semester.   |
|---|--|
| Requirements for awarding credit points (type of examination) | Oral examination (100%)  |
| Additional information on the module                          | 128 M.Sc.Physics: Specialization "Solid state physics / Material science". If requested by the participants and agreed on with the responsible teacher, this module can be offered on-site and/or online (hybrid). |
| Recommended reading   | A list of Literature and materials will be provided at the beginning of the semester.  |
| Language of instruction                                       | English  |

Page 10 of 138 generated 01.10.2025

| Content   | Lecture of Drs. Eilenberger, Steinlechner  • Basic introduction to quantum optics;  • Quantum light sources;  • Encoding,  • transmission and detection of information with quantum light;  • Quantum communication and cryptography;  • Quantum communication networks;  • Outlook on Quantum metrology and Quantum imaging;   |
|---|---|
|   | Lecture of Dr. Sondenheimer  • Open quantum systems, Density matrix formalism, Generalized measurements, Quantum channels  • Superdense coding, quantum teleportation  • Entanglement theory, Bell inequalities,  • CHSH inequalities  • Quantum circuits, universal gates  • Quantum error correction  |
| Intended learning outcomes                                    | <span dir="ltr">The course will give a basic introduction into the usage of quantum states of light for the exchange of information. It will introduce contemporary methods for the generation of quantum light and schemes that leverage these states for the exchange of information, rangingfrom fundamental concepts and experiments to state of the artimplementations for secure communication networks. The course willalso give an outlook to aspects of Quantum metrology and imaging. Afteractive participation in the course, the students will be familiarwith the basic concepts and phenomena of quantum information exchangeand some aspects related to the practical implementation thereof. They will be able to apply their knowledge in the assessment and setup of experiments and devices for applications of quantuminformation processing. Vermittlung grundlegender Kenntnisse zur Übertragung und Verarbeitung von Information mit Hilfe von Quantensystemen als InformationsträgerInformationstheoretische Beherrschung der Verschränktheit von Quantensystemen.</span> |
| Prerequisites for admission to the module examination         | -   |
| Requirements for awarding credit points (type of examination) | Written or oral examination (100%); The selected form of the exam will be announced at the beginning of the semester.   |
| Additional information on the module                          |   |
| Recommended reading   | A list of literature and materials will be provided at the beginning of the semester.   |
| Language of instruction                                       | English   |

| Modul PAFMO001 Fundament  | tals of Modern Optics  |
|---|--|
| Module code   | PAFMO001   |
| Module title (German)   | Fundamentals of Modern Optics  |
| Module title (English)  | Fundamentals of Modern Optics  |
| Person responsible for the module   | Prof. Dr. T. Pertsch   |
| Prerequisites for admission to the module   | -  |
| Recommended or expected prior knowledge   | -  |
| Prerequisite for what other modules   | -  |
| Type of module (compulsory module, required elective module, elective module)                                 | 628 M.Sc. Photonics: Compulsory Module<br>528 M.Sc. Quantum Science and Technology, required elective module,<br>subject area "adjustment"   |
| Frequency of offer (how often is the module offered?)   | Every second semester (beginning in winter semester)   |
| Duration of module  | 1 semester   |
| Module Components/Types of courses (lecture, practical course, lab, tutorial, exercise, seminar, internship,) | Lecture: 4 h per week Exercise: 2 h per week   |
| ECTS credits  | 8 CP   |
| Work load: - In-class studying - Independent studying (incl. preparations for examination)                    | 240 h<br>90 h<br>150 h   |
| Content   | <ul> <li>Basic concepts of wave optics</li> <li>Dielectric function to describe light-matter interaction</li> <li>Propagation of beams and pulses</li> <li>Diffraction theory- Elements of Fourier optics</li> <li>Polarization of light</li> <li>Light in structured media</li> <li>Optics in crystals</li> </ul>   |
| Intended learning outcomes  | The course covers the fundamentals of modern optics which are necessary for the understanding of optical phenomena in modern science and technology. The students will acquire a thorough knowledge of the most important concepts of modern optics. At the same time the importance and applications of optics in technology will be taught. This will enable students to solve advanced problems in general optics and follow more specialized courses in photonics. |

| Content   | Introduction to laser physics (stimulated emission, atomic rate equations, laser pumping and population inversion); Optical beams and laser resonators; Laser dynamics; Q-switching; Mode locking; Wavelength tuning and single frequency operation; Laser systems; Selected industrial and scientific applications.   |
| Intended learning outcomes  | This course provides an introduction to the basic ideas of laser physics. The first part presents the fundamental equations and concepts of laser theory, while the second part is devoted to a detailed discussion of selected laser applications. The students are introduced to the different types of lasers including classical gas or ruby lasers as well as modern high-power diode pumped solid-state concepts and their applications. As a result the students are enabled to solve problems related to the generation of light with different types of lasers. |

| Concepts of ray tracing; Modeling and design of lens systems; Image formation; Physical properties of lenses and lens materials in optical design; Image aberrations and methods to avoid them; Vectorial harmonic fields; Plane waves; Fourier transformation and spectrum of plane waves representation; Concepts of field tracing; Propagation techniques through homogeneous and isotropic media; Numerical properties of propagation techniques.  |
| The course enables students to solve problems related to the modeling and design of optical elements and systems. In the first part of the lecture we focus on ray-tracing techniques and its application through image formation. Then we combine the concepts with physical optics and obtain field tracing. It enables the propagation of vectorial harmonic fields through optical systems. In practical exercises the students will get an introduction to the use of commercial optics modeling and design software. |

| Content   | Electro-optical modulation; Acousto-optical devices; Magneto-optics and optical isolation; Integrated lasers; Non-Linear devices for light generation;  |
| Intended learning outcomes  | Based on this course the students will acquire a comprehensive overview about active photonic devices such as switches or modulators. The course starts by an introduction to the most important parameters and physical principles. The Lecture will then focus onto real-world devices including the areas of electro-optics, waveguides, acousto-optics, magneto-optics and non-linear optics. During this lecture the fundamental principles as well as devices currently employed in photonics will be discussed to provide the students with the ability to solve related problems and to perform research in related fields. |

| Content   | Applied Laser Technology using the laser as a tool, microscopic and macroscopic light-materials-interactions, material preparation and modification (with the exception of classical laser materials' processing   |
| Intended learning outcomes  | In various selected topics out of the broad field of laser applications, the students will acquire the knowledge to solve problems related to laser-material interactions (e.g. atom cooling and optical tweezer), laser induced processes in gases, liquids, and matrices (incl. laser isotope separation), materials´ preparation and structuring by ablation, deposition and/or modification. |
| Prerequisites for admission to the module examination   | -  |
| Requirements for awarding credit points (type of examination)   | Written or oral examination (100%) The selected form of the exam will be announced at the beginning of the semester.   |
| Additional information on the module  | 128 M.Sc. Physics: Required elective module (Specialization in "Optics") If requested by the participants and agreed on with the responsible teacher, this module can be offered on-site and/or online (hybrid).   |

| Intended learning outcomes                                    | The Module provides insight into the basic techniques and concepts in physics related to extreme electromagnetic fields. Their relevance to nowadays applications will be discussed in addition. The Module also introduces the basic interaction processes of high-energy photon and particle beams with matter, including recent developments of high intensity radiation sources, such as free electron lasers and modern particle accelerators. Experimental methods and the related theoretical description will be reviewed in great detail. |

| Content   | Coherent electron dynamics in atoms and molecules; Strong field effects and ionization; High harmonic generation and phase matching; Techniques for attosecond pulse generation; Transient absorption; Attosecond quantum optics with few-level quantum models.   |
| Intended learning outcomes  | The course gives an introduction into the young research field of attosecond physics. Electron dynamics in atoms and molecules on the attosecond time scale (which is the natural timescale for bound electrons) will be discussed, along with modern techniques for attosecond pulse generation and characterization to enable the students to solve related problems. |

| Content   | Introduction to biomedical and medical imaging systems; Physical principles behind the design of selected imaging systems; Technological aspects of each modality; Spatial and temporal resolution; Importance or each modality concerning physical, biological and clinical applications.   |
| Intended learning outcomes  | The course introduces the physical principles, properties and technical concepts of imaging systems as they are applied today in medicine and physics. The focus is laid on the use and application of ionizing radiation which has always been an important aspect of the application of physics to medicine. Applications and current developments will be presented. After having actively participated the students should demonstrate a critical understanding of the theoretical basis and technologies of these imaging systems and have acquired an appreciation of instrumentation and practical issues with different imaging systems. The course is independent of the course Biomedical Imaging – Non-Ionizing Radiation offered in the 2nd semester and does not require previous participation of that course. |
| Prerequisites for admission to the module examination   | students must have earned points in the exercises and assignments (type and extent will be announced at the beginning of the semester)   |

| Content   | The Module provides a deep introduction into the multitude of possible linear and non-linear light biological matter interaction phenomena and  |
|---|---|
|   | thus in modern techniques and applications of frequency-, spatially-, and time-resolved bio-spectroscopy. The course presents a comprehensive overview over modern spectroscopic and optical imaging techniques inclusive specific theoretical methodologies to analyze the experimental spectroscopic data to resolve problems in life sciences. The biological part introduces to molecular and cellular properties of living organisms. It explains the basic structures and functions of prokaryotic and eukaryotic cells as well as the most important biochemical substance classes and biochemical pathways where they are involved. Furthermore basics in microbiology, especially in antimicrobial resistant bacteria will be provided and combined with the introduction of diagnostic principles and selected infectious diseases. Examples for molecular and serological assay and test development and basic methods for diagnostics and epidemiology will be discussed. This sets the stage for biophotonic applications by showing several examples of how biophotonics can help to shed light on biologically and clinically relevant processes. The Module spans aspects of the scientific disciplines chemistry, physics, biology and medicine. The Exercises will be partly calculating examples and partly in the form a seminar talks of the students presenting current research publications. Intended learning outcomes: The aim of this course is to present modern methods in spectroscopy, microscopy, molecular biology, microbiology and imaging dedicated to biological samples. After the course the students will be able to choose and to apply appropriate spectroscopic methods and imaging technologies to resolve special biophotonics problems. |

| Content   | Short review of Maxwell's equations and the wave equation; Free space propagation techniques; Beam propagation methods applied to problems in integrated optics; Mode expansion techniques applied to stratified media; Finite-Difference Time-Domain method; Finite Difference Time-Domain Method; Finite Element Method; Mode expansion techniques applied to gratings; Other grating techniques; Contemporary problems in computational photonics.   |
| Intended learning outcomes  | The course aims at an introduction to various techniques used for computer-based optical simulation. Therefore, the student should learn how to solve Maxwell's equations in homogenous and inhomogeneous media rigorously as well as on different levels of approximation. The course concentrates predominantly on teaching numerical techniques that are useful in the field of micro- and nanooptics. After completing the course the students will be able to select the right method of computational photonics based on the properties of the investigated system, implement the method in a programming language of their choice, and investigate the physical properties of the optical system using their method. |

| Content   | The seminar covers the history of optics from the antiquity to the 20th century: Starting with Greek heories of vision and ending with quantum optics. A strong focus will be given on the development of concepts and experiments that influenced todays thinking about light and optics, such as wave particle dualism or the Abbe diffraction limit. An excursion the Jena's Optical Museum is part of the seminar. |
| Intended learning outcomes  | In close collaboration with the supervisor, the student will work on an independent project. The students will develop the ability to evaluate critically the arguments and analytical methods of historians. They will learn developing their own interpretations based on critical assessments of primary source evidence and independent research.  |

| Content   | We will show different methodologies to extract specific information such as for example the average speed of diffusing particles or the locations and areas of cells from the multidimensional image data. Also fitting quantitative models to extracted data will be treated. Simulation of far-field intensity distribution by using simple Fourier-space based approaches is treated with and without considering the vectorial nature of the oscillating electro-magnetic field. |

Page 68 of 138 generated 01.10.2025

| Intended learning outcomes                                    | Current microscopy often acquires a large amount of image data from which the biological or clinical researcher often needs to answer very specific questions. A major topic is the reconstruction of the sample from the acquired, often complex, microscopy data. To solve such inverse problems, a good model of the data acquisition process is required, ranging from assumptions about the sample (e.g. a positive concentration of molecules per voxel), assumptions about the imaging process (e.g. the existence of an incoherent spatially invariant point spread function) to modeling the noise characteristics of the detection process (e.g. read noise and photon noise). The students will be enabled to solve related problems. |

| Intended learning outcomes  | The course provides an introduction to the broad research field of nanooptics. The students will learn about different concepts which are applied to control the emission, propagation, and absorption of light at subwavelength spatial dimensions. Furthermore, they will learn how nanostructures can be used to optically interact selectively with nanoscale matter, a capability not achievable with standard diffraction limited microscopy. After successful completion of the course the students should be capable of understanding present problems of the research field and should be able to solve basic problems using advanced literature. |

| Content   | The lecture will cover a significant part of integrated quantum photonics, which is one of the pillars of the current quantum technology development. In particular, the lecture will cover the following topics  • Integrated optics on a single photon level  • Generation and manipulation of quantum states of light using integrated waveguides  • Overview over integrated photonic platforms and fabrication of passive and active waveguide structures  • Quantum walks in linear and non-linear waveguide lattices  • Introduction to photonic quantum computation and simulation  • Measurements using superconducting nanowire single photon detectors and transition edge sensors |

| Content   | <ul> <li>Rapid prototyping technologies in photonics</li> <li>Innovation management and design thinking</li> <li>Hands-on/practical examples of photonics prototyping</li> <li>Entrepreneurial skills and business modelling</li> <li>Basics of intellectual property rights</li> </ul>  |
| Intended learning outcomes  | The students will learn how the results of their scientific research can be turned into relevant innovations as an important part of their future career. On the one hand, the course will enable students to understand and to drive innovation processes in photonics companies. On the other hand, students will develop an entrepreneurial skill set for the independent economical exploitation of scientific ideas.  Therefore, the course introduces the basic knowledge on innovation management, entrepreneurship, and intellectual property rights. To practice their skills, the students will also conduct their own photonics innovation project during the semester by working hands-on in small teams in the photonics makerspace Lichtwerkstatt. During this practical part, they acquire and apply a thorough knowledge of photonic rapid prototyping technologies (e.g. 3d-scanning and printing, laser cutting, microcontrollers,) and the most important creativity methods and project management skills. To cover this range of topics, the course will be supported by guest lecturers from different sectors (academia, industry). |

| Content   | <ul> <li>origin and dependencies of absorption and emission cross sections</li> <li>Ytterbium based laser media</li> <li>design of laser diode pump engines,</li> <li>special topics in geometrical optics for amplifier design</li> <li>basic calculations for layout of diode pumped high energy amplifiers</li> <li>Ytterbium based laser materials and cryogenic cooling</li> <li>limitations and special topics (laser induced damage threshold (LIDT), amplified spontaneous emission (ASE))</li> </ul>  |
| Intended learning outcomes  | This is an application-oriented course focusing on topics needed for development and design of diode pumped high energy class laser systems. Besides general topics the main part of this lecture is dedicated to ytterbium-based laser systems. Besides basic knowledge like the spectral properties of laser materials and their significance for a laser system, further key topics like laser induced damage thresholds, laser diode pump engines, modeling of amplification and amplified spontaneous emission will be discussed. Students will be enabled to solve related problems. |

| Content   | Starting from geometrical optics the imaging system will be described and optical aberrations will be discussed. Moving on to wave optics monochromatic waves will be taken as the basis for the description of coherent imaging. Combined with scattering theory in the 1st Born approximation a fundamental understanding of the possibilities and limitations in imaging is gained. The concept of the amplitude transfer function and McCutchens 3-dimensional pupil function are introduced. |
|   | On this basis various coherent imaging modes are discussed including holographic approaches and their limitations, and optical coherent tomography.  The working principles of light-detectors are discussed and the  |
|   | requirements for appropriate sampling of images.  Finally various modes of fluorescence microscopy and high-resolution  |
|   | microscopy will be covered.   |
|   | The exercises will be calculating examples, also involving hands-on computer based modeling using Matlab and other tools.   |

| Intended learning outcomes                                    | A large diversity of nanomaterials can be efficiently produced by utilizing chemical synthesis strategies. The wide range of nanomaterials, i.e., nanoparticles, nanotubes, micelles, vesicles, nanostructured phase separated surface layers etc. opens on the one hand versatile possibilities to build functional systems, on the other hand also the large variety of techniques and processes to fabricate such systems is also difficult to overlook.  |
|---|--|
|   | Traditionally the communication in the interdisciplinary field of nanotechnology is difficult, as expertise from different research areas is combined. This course aims on the creation of a common basic level for communication and knowledge of researchers of different research fields and to highlight interdisciplinary approaches which lead to new fabrication strategies. The course includes basic chemical synthesis strategies, molecular self-assembly processes, chemical surface structuring, nanofabrication and surface chemistry to create a pool of knowledge to be able to use molecular building blocks in future research projects. |

| Content   | <ul> <li>Electrons in constant fields</li> <li>Electrons in electromagnetic pulses</li> <li>Radiation produced by particles in extreme motion</li> <li>Radiation reaction</li> <li>QED effects in strong laser fields</li> </ul>   |
| Intended learning outcomes  | This course is devoted to the dynamics of charged particles in electromagnetic fields. Starting with motion of electrons in constant magnetic and electric fields, the course continues with the electron motion in electromagnetic pulses (i.e. laser pulses) of high strength (i.e. when laser pressure becomes dominant). Radiation produced by electrons in extreme motion will be calculated for several most important cases: synchrotron radiation, Thomson scattering, undulator radiation. Effects of radiation reaction on electron motion will be discussed. The last part of the course will briefly discuss the QED effects in strong laser fields: stochasticity in radiation reaction, pair production by focused laser pulses and QED cascades. Analytical framework will be complemented with the help of numerical calculations. |

| Type of module (compulsory module, required elective module, elective module)                                 | 128 M.Sc. Physics focus "Optics": Required elective module 628 M.Sc. Photonics: Required elective module 528 M.Sc. Quantum Science and Technology, required elective module, subject area "specialization"  |
| Frequency of offer (how often is the module offered?)   | Every second semester (beginning in summer semester)  |
| Duration of module  | 1 semester  |
| Module Components/Types of courses (lecture, practical course, lab, tutorial, exercise, seminar, internship,) | Lecture: 2 h per week<br>Exercise: 1 h per week   |
| ECTS credits  | 4 CP  |
| Work load: - In-class studying - Independent studying (incl. preparations for examination)                    | 120 h<br>45 h<br>75 h   |
| Content   | <ul> <li>Basic introduction to algorithms and computing</li> <li>The Qubit and entanglement thereof</li> <li>Basics of quantum algorithms</li> <li>Advanced quantum algorithms</li> <li>Implementation of QuBits and quantum computers</li> <li>Hands-on circuits</li> </ul>  |
| Intended learning outcomes  | After active participation in the course, the students will be familiar with the basic concepts of quantum computation and the implementation of quantum algorithms. They will be able to apply their knowledge in the assessment and creation of quantum algorithms and the development or quantum information systems.  The intended learning outcome is to introduce the students to the basic usage of quantum bits for information processing. To provide further insight, the course will expand this concept on multipartite systems and introduce the concept of entanglement.  In a further step we shall see how individual quantum operations tie together to create algorithms. Important algorithms, such as the quantum Fourier transformation, the algorithms of Shor and Grover will be discussed. To relate the abstract knowledge on quantum algorithms to practical applications, real-world implementations of quantum computers will be discussed. |

| Intended learning outcomes  | Goals: The course will give a basic introduction into the usage of quantum states of light for the exchange of generation of quantum light and schemes that leverage these states for the exchange of information, ranging from fundamental concepts and experiments to state of the art implementations for secure communication networks. The course will also give an outlook to aspects of Quantum metrology and imaging. After active participation in the course, the students will be familiar with the basic concepts and phenomena of quantum information exchange and some aspects related to the practical implementation thereof. They will be able to apply their knowledge in the assessment and setup of experiments and devices for applications of quantum information processing. |
| Requirements for awarding credit points (type of examination)   | Written or oral examination (100%)  The form of the exam will be announced at the beginning of the semester.  |

| Intended learning outcomes                                    | This course aims to convey a fundamental understanding of the physics governing the optical and optoelectronic properties of semiconductor nanomaterials. First, the fundamental optical and optoelectronic properties of bulk semiconductors are reviewed, deepening and extending previously obtained knowledge in condensed matter physics. The students will then learn about the effects of quantum confinement in semiconductor systems in one, two or three spatial dimensions, as well as about photonic effects in nanostructured semiconductors. Finally, several relevant examples of semiconductor nanomaterial systems and their applications in photonics are discussed in detail. After successful completion of the course, the students should be capable of understanding present research directions and of solving basic problems within this field of research. |

| Module title (English)  | Topics of Current Research 2   |
| Person responsible for the module   | N.N.   |
| Prerequisites for admission to the module   | -  |
| Recommended or expected prior knowledge   | -  |
| Prerequisite for what other modules   | -  |
|   | 128 M.Sc. Physics: Required elective module  |
| required elective module, elective module)  | 628 M.Sc. Photonics: Required elective module  |
| Frequency of offer (how often is the module offered?)   | Every second year (beginning in summer semester)   |
| Duration of module  | 1 semester   |
| Module Components/Types of courses (lecture, practical course, lab, tutorial, exercise, seminar, internship,) | Lecture: 2 h per week Exercise: 1 h per week   |
| ECTS credits  | 4 CP   |
| Work load: - In-class studying - Independent studying (incl. preparations for examination)                    | 120 h<br>45 h<br>75 h  |
| Content   | Advanced topics of current research in optics and photonics  |
| Intended learning outcomes  | <ul> <li>Introduction into a field of current ressearch as a basis for further study and research in this field;</li> <li>Independent solution of exercise problems;</li> <li>Ability to acquire further knowledge by independent literature studies.</li> </ul> |
| Prerequisites for admission to the module examination   | Course exercises to be submitted; further information on the kind and scope will be given at the beginning of each semester.   |
| Requirements for awarding credit points (type of examination)   | Written or oral examination (100%). The selected form of the exam will be announced at the beginning of the semester.  |
| Additional information on the module  | 128 M.Sc. Physics: Required elective module (Specialization in "Optics") If requested by the participants and agreed on with the responsible teacher, this module can be offered on-site and/or online (hybrid).   |
| Recommended reading   | A list of Literature and materials will be provided at the beginning of the semester.  |
